

1) You are given a 2D array. You have to find the minimum element in the array.

⇒ Array has special properties

→ It is row wise & column wise sorted ^{Increasing} but rows are first shifted by k_1 & columns are shifted by k_2 . k_1, k_2 are not given.

Ex:

1	2	3
4	5	6
7	8	9

⇒ Row-wise & columnwise sorted (ie) increasingly

↓ Row shift by 2

3	2	1
6	5	4
9	8	7

→
column
shift
by
1

9	8	7
3	2	1
6	5	4

Answer

⇒ This is the array given

Give optimal solution. [Can be a rectangular array need not be square]

2) Given

```
class TreeNode {
```

```
    int val;
```

```
    int id;
```

```
    TreeNode left;
```

```
    TreeNode right;
```

```
}
```

val \Rightarrow distance from its ~~to~~ parent to this node

id \Rightarrow id of the node

left \Rightarrow left child

right \Rightarrow right child

You are given a tree consisting of nodes in the form of ~~TreeNode~~ ~~TreeNode~~. You are also given a id. ~~the~~ We have to

find ~~not~~ the id's of nodes which are at a distance

of x such that $x \in [a, b]$ (i.e) $a \leq x \leq b$. a, b are also given.

Similarity

→ Given 5, distances lie between [6, 20]

↓

answer ⇒ [2, 1, 3]

↓
order does not matter
